

Secondary Internet Access Information Sheet

Overview

To lessen the impact of internet bound traffic from various remote sites on the Town Hall gateway, a second connection to the internet has been installed. Internet traffic from these 2 locations is now routed through this new connection. In an effort to conserve bandwidth and increase access speed, a proxy server has been installed to cache content and control access. All traffic passing through this server is scanned for malicious content by an Internet Web Security Suite. To enforce compliance with the Town's computer use policy, a filtering appliance blocks access to inappropriate web content.

Highlights

- Access to the internet through a local connection
- Cached content allows for faster access to frequently requested static pages
- Computer use policy enforce by filtering appliance
- Web traffic scanned and cleaned of malicious content

Interaction with Other Systems

- Enterprise Reporter
